

# Is your child having their meningococcal B vaccine today?

It is recommended to give your child one dose of paracetamol **30 minutes prior** to being vaccinated with Bexsero®. If this is not possible, paracetamol should be given as soon as you can after the vaccination.

To reduce the risk of high fever, give one dose of paracetamol **every six hours**, at least two more times after the vaccination even if your child does not have a fever.

Ask your immunisation provider or doctor about paracetamol administration, refer to the paracetamol factsheet and always **follow the instructions** on the label.
